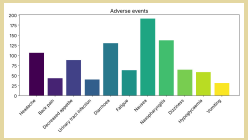
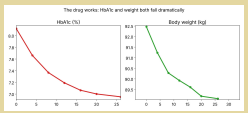
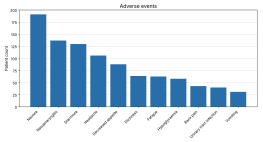
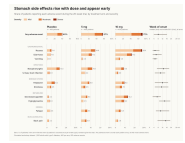
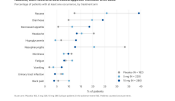
Round 1

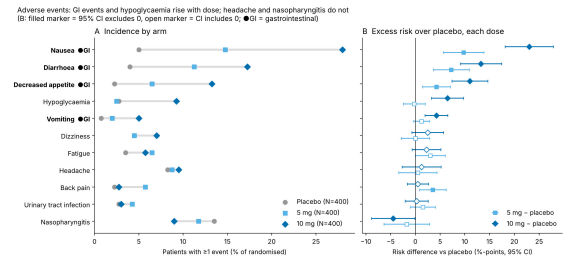


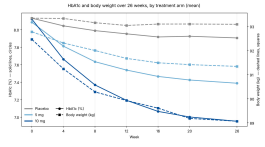


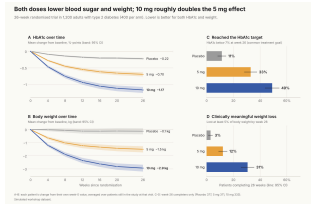


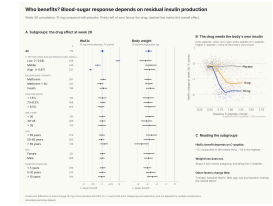


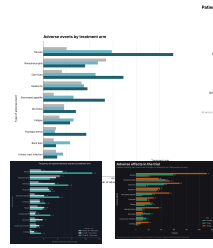


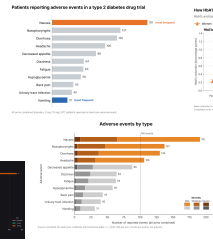


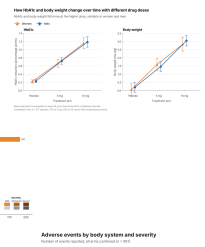


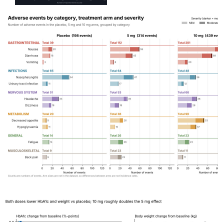


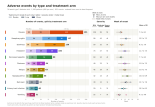


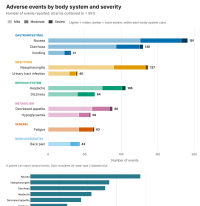


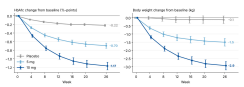


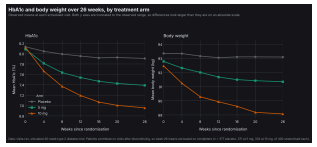


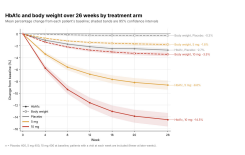


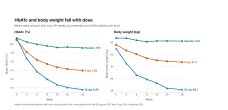


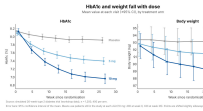


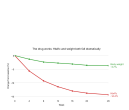


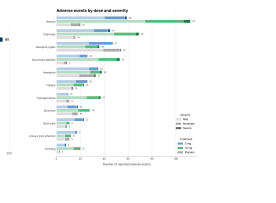


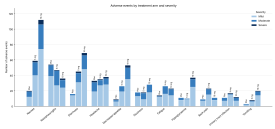


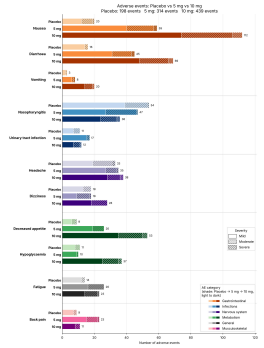


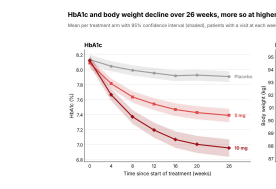


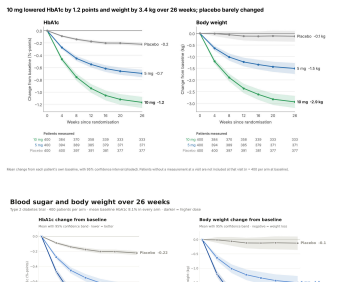


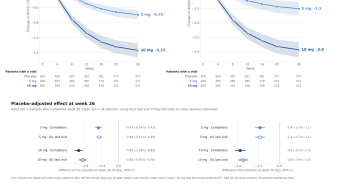


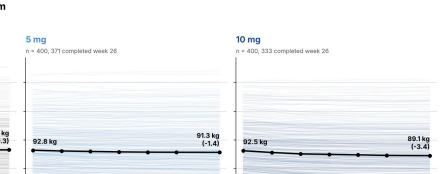


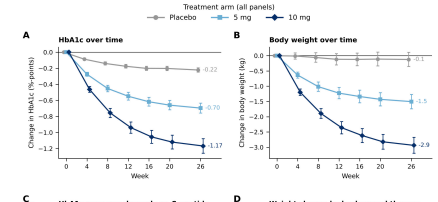




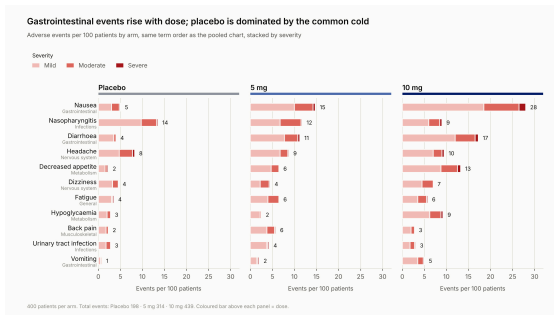


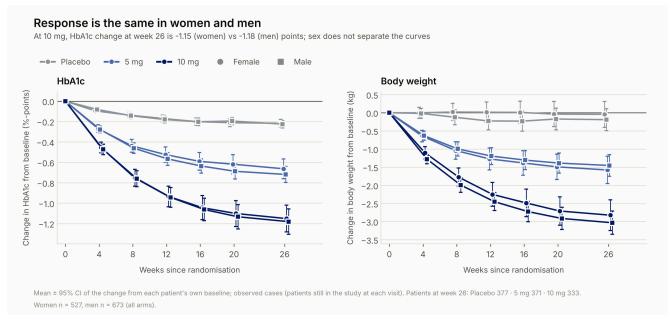




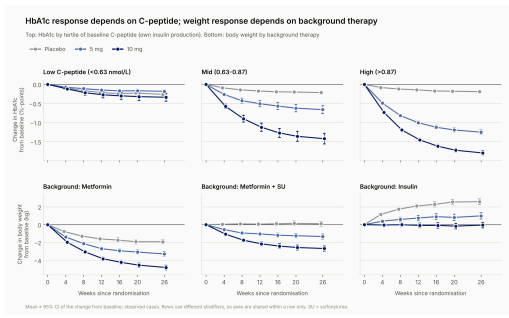


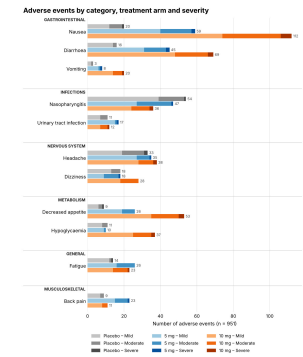
GROUP G.A.C.

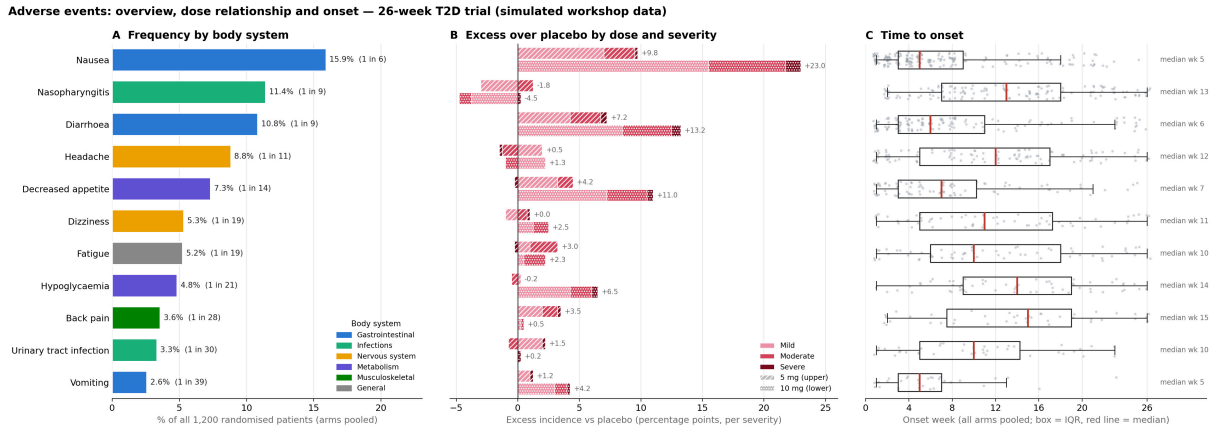




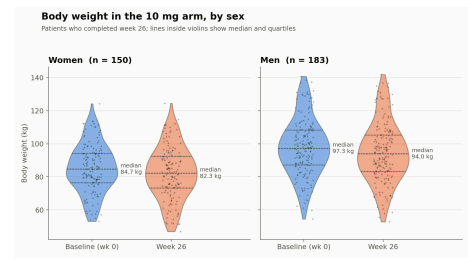
Suppl.

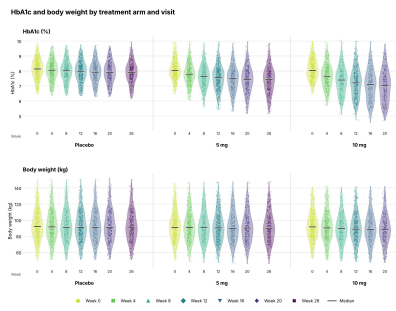




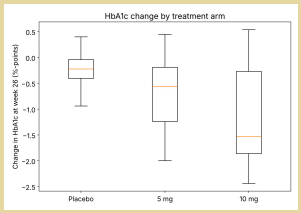


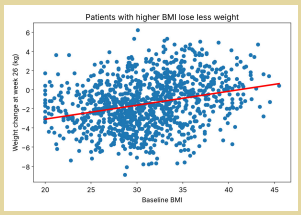
Patients counted once per event term. A: n = 1,200. B: arm % minus placebo % within each severity grade (n = 400 per arm); bars left of 0 = fewer than placebo; number = net difference. Severe grade based on 0-6 patients per arm and term.
C: onset week of each event; patients who discontinued early contribute no later onsets, so late onsets may be under-represented. Descriptive only, no statistical testing.

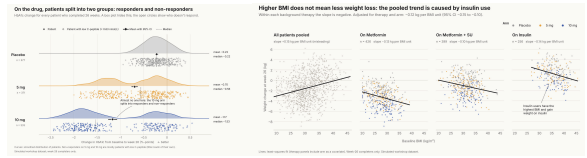


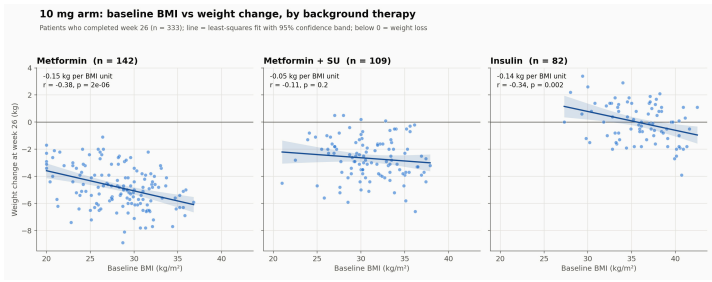


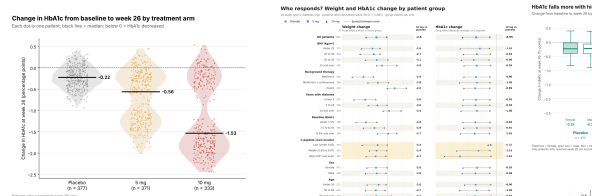
Round 2

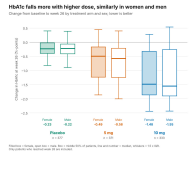


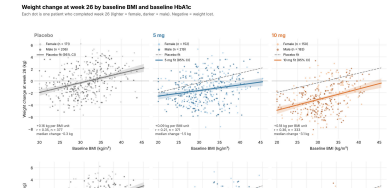


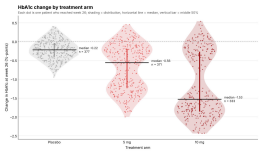


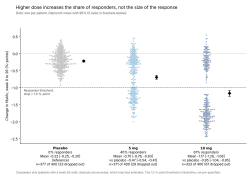


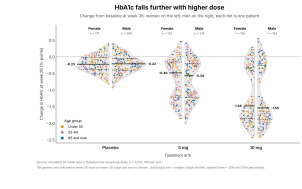


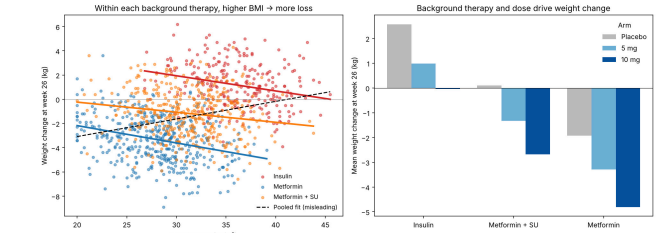


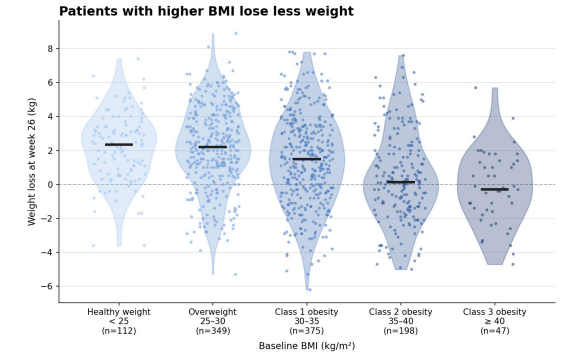


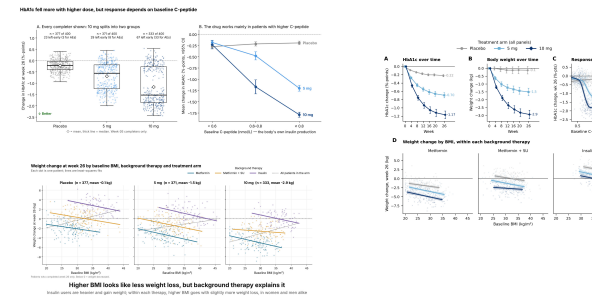


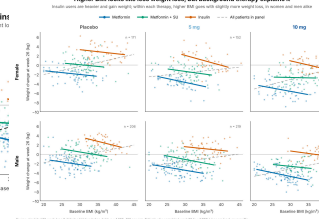


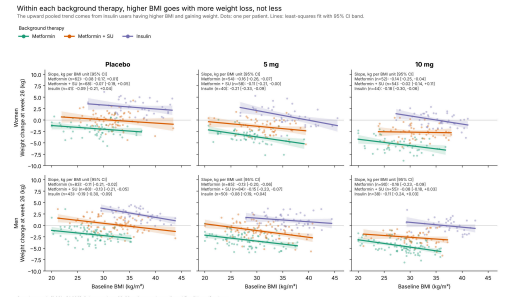


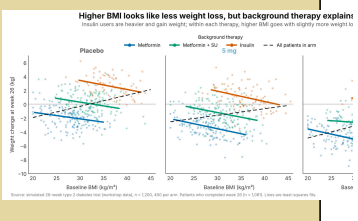


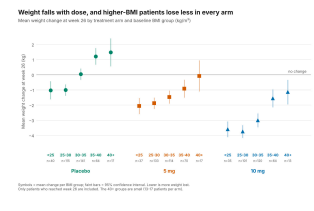


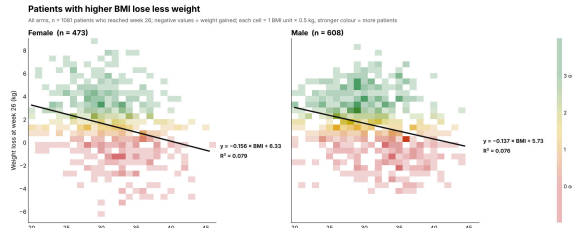


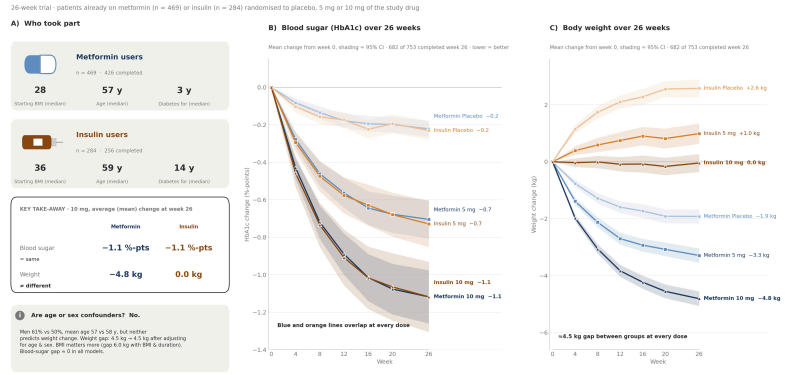


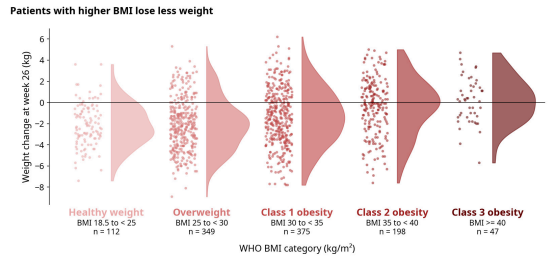


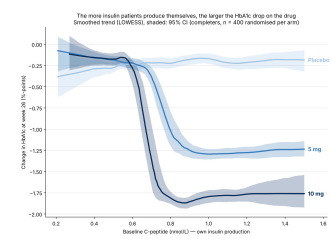




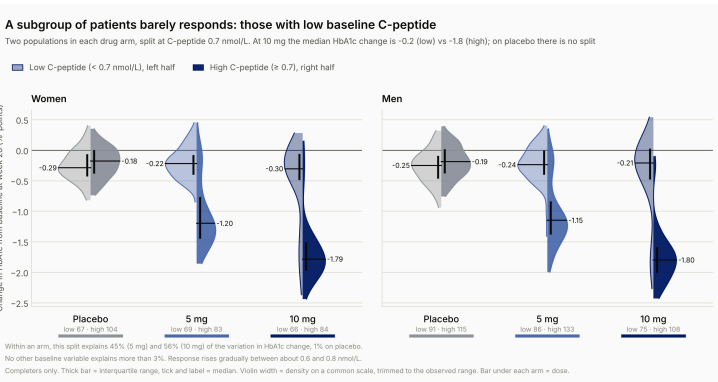


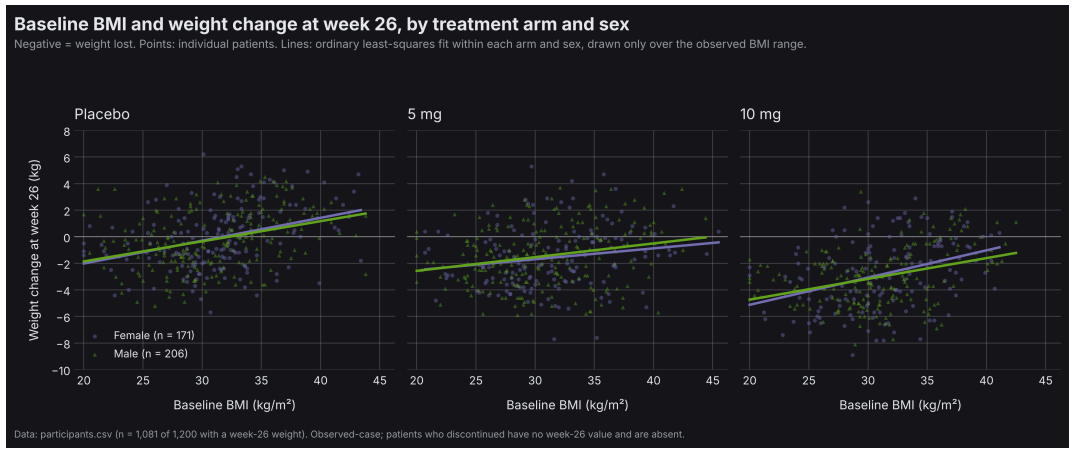




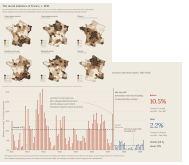


GROUP G.A.C.

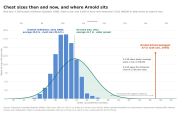


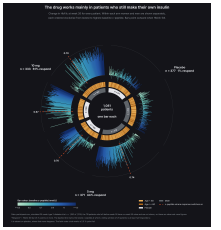


Round 3

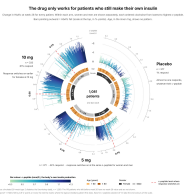


10.5%
2.2%

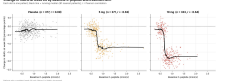


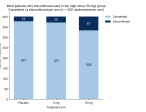


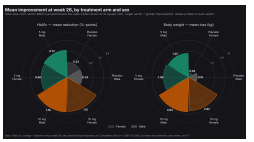
The drug only works for patients who still make their own insulin



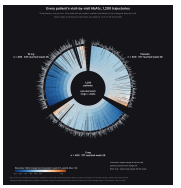
The drug only works for patients who still make their own insulin

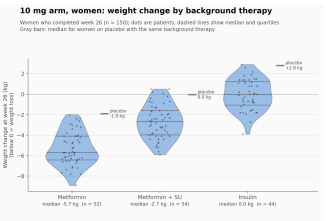




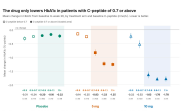


Mean improvement at week 26, by treatment arm and sex

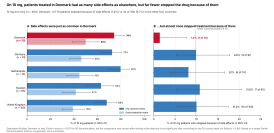




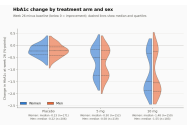
10 mg arm, women: weight change by background therapy
Women who completed week 26 (n = 150); dots are patients, dashed lines show median and quartiles
Gray bars: median for women on placebo with the same background therapy
Weight change at week 26 (kg)
(below 0 = weight loss)
placebo +2.0 kg
placebo 0.9 kg
placebo 1.9 kg
Metformin
median -5.7 kg (n = 52)
Metformin + SU
median -2.7 kg (n = 54)
Insulin
median 0.0 kg (n = 44)



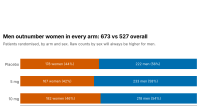
The drug only lowers HbA1c in patients with C-peptide of 0.7 or above
Placebo
5 mg
10 mg



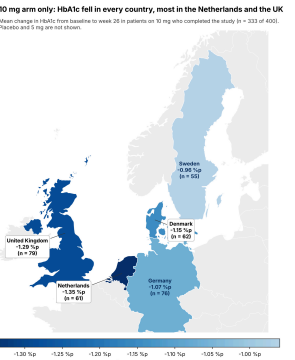
On 10 mg, patients treated in Denmark had as many side effects as elsewhere, but far fewer stopped the drug because of them



HbA1c change by treatment arm and sex
Placebo
5 mg
10 mg



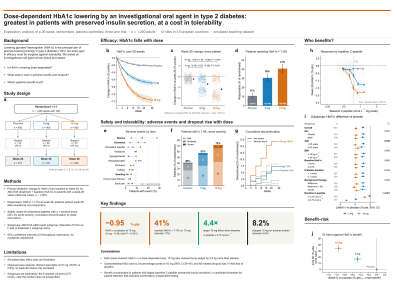
Men outnumber women in every arm: 673 vs 527 overall
Placebo
5 mg
10 mg



10 mg arm only: HbA1c fell in every country, most in the Netherlands and the UK
Mean change in HbA1c from baseline to week 26 in patients on 10 mg who completed the study (n = 333 of 400). Placebo and 5 mg are not shown.
Sweden
-0.98 %p
(n = 55)
United Kingdom
-1.29 %p
(n = 79)
Denmark
-1.15 %p
(n = 60)
Netherlands
-1.35 %p
(n = 61)
Germany
-1.07 %p
(n = 78)
-1.35 %p
-1.30 %p
-1.25 %p
-1.20 %p
-1.15 %p
-1.10 %p
-1.05 %p
-1.00 %p
Mean change in HbA1c at week 26 (%p + percentage points) — darker = larger drop
Country differences are not statistically significant: arm × country interaction p = 0.03 among completers, p = 0.51 after correcting for multiple tests, and p = 0.19 when dropouts are included. Map: Natural Earth (public domain).

In lobster terms, baseline BMI barely matters once you account for background therapy

At 10 mg, GI side effects hit men harder; nausea in 33% of men vs 27% of women



Dose-dependent HbA1c lowering by an investigational oral agent in type 2 diabetes: greatest in patients with preserved insulin secretion, at a cost in tolerability
Background
Efficacy: HbA1c falls with dose
Who benefits?
Study design
Methods
Safety and tolerability: adverse events and dropout rise with dose
Benefit–risk
Key findings
−0.95
41%
4.4×

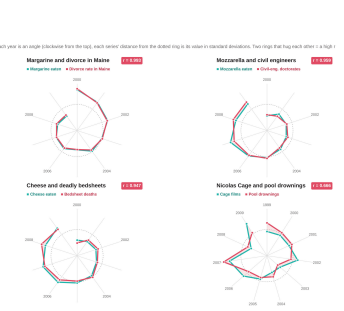
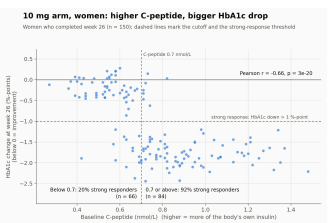
Limitations
Conclusions



Each year is an angle (clockwise from the top), each series' distance from the dotted ring is its value in standard deviations. Two rings that hug each other = a high r
Margarine and divorce in Maine
r = 0.993
Margarine eaten
Divorces rate in Maine
Mozzarella and civil engineers
r = 0.959
Mozzarella eaten
Civil eng. doctorates
Cheese and deadly bedsheets
r = 0.947
Cheese eaten
Bedsheet deaths
Nicolas Cage and pool drownings
r = 0.989
Cage films
Pool drownings
Head-yearly-series.ai compiled by Tyler Vigen (tylervigen.com/data.com). Shaded gap between the rings = disagreement between the two series. Start year is at the top; the circle stays open before the axis tag.



10 mg arm, women: higher C-peptide, bigger HbA1c drop
Women who completed week 26 (n = 150); dashed lines mark the cutoff and the strong-response threshold
C-peptide 0.7 nmol/L
Pearson r = -0.66, p = 3e-20
strong response: HbA1c down > 1 %-point
HbA1c change at week 26 (%-points)
(below 0 = improvement)
Below 0.7: 26% strong responders
(n = 66)
0.7 or above: 92% strong responders
(n = 84)
Baseline C-peptide (nmol/L) (higher = more of the body's own insulin)

USE

Idea development

Identify trends

to be critical about your plots.

insert labels/ highlights / customization that is otherwise hard to implement

script for generating plot

try out different chart types

polish a chart

brainstorming - generating ideas + improvements

for thinking out-of-the-box

quickly spotting what the data actually show --> trends

NOT USE

Patent pending or confidential data

if not able to validate or verify

Unpublished data

make AI-styled plots

generate "images" rather than charts, make sure it is plotted from the data

confidential data

no knowledge of the data - you need to know your data

"blindly" use the results without doubting them
